Chapter 1

Functions

1.1 squarefree – Squarefreeness tests

There are two method groups. A function in one group raises **Undetermined** when it cannot determine squarefreeness. A function in another group returns **None** in such cases. The latter group of functions have “_ternary” suffix on their names. We refer a set $\{\mathbf{True}, \mathbf{False}, \mathbf{None}\}$ as *ternary*.

The parameter type *integer* means either *int*, *long* or **Integer**.

This module provides an exception class.

Undetermined : Report undetermined state of calculation. The exception will be raised by **lenstra** or **trivial_test**.

1.1.1 Definition

We define squarefreeness as:

n is squarefree \iff there is no prime p whose square divides n .

Examples:

- 0 is non-squarefree because any square of prime can divide 0.
- 1 is squarefree because there is no prime dividing 1.
- 2, 3, 5, and any other primes are squarefree.
- 4, 8, 9, 12, 16 are non-squarefree composites.
- 6, 10, 14, 15, 21 are squarefree composites.

1.1.2 lenstra – Lenstra’s condition

lenstra(n : *integer*) \rightarrow *bool*

If return value is True, n is squarefree. Otherwise, the squarefreeness is still unknown and **Undetermined** is raised. The algorithm is based on [?].

†The condition is so strong that it seems n has to be a prime or a Carmichael number to satisfy it.

Input parameter n ought to be an odd **integer**.

1.1.3 `trial_division` – trial division

`trial_division(n: integer) → bool`

Check whether n is squarefree or not.

The method is a kind of trial division and inefficient for large numbers.

Input parameter n ought to be an **integer**.

1.1.4 `trivial_test` – trivial tests

`trivial_test(n: integer) → bool`

Check whether n is squarefree or not. If the squarefreeness is still unknown, then **Undetermined** is raised.

This method do anything but factorization including Lenstra’s method.

Input parameter n ought to be an odd **integer**.

1.1.5 `viafactor` – via factorization

`viafactor(n: integer) → bool`

Check whether n is squarefree or not.

It is obvious that if one knows the prime factorization of the number, he/she can tell whether the number is squarefree or not.

Input parameter n ought to be an **integer**.

1.1.6 `viadecomposition` – via partial factorization

`viadecomposition(n: integer) → bool`

Test the squarefreeness of `n`. The return value is either one of `True` or `False`; `None` never be returned.

The method uses partial factorization into squarefree parts, if such partial factorization is possible. In other cases, It completely factor `n` by trial division.

Input parameter `n` ought to be an **integer**.

1.1.7 `lenstra_ternary` – Lenstra’s condition, ternary version

`lenstra_ternary(n: integer) → ternary`

Test the squarefreeness of `n`. The return value is one of the ternary logical constants. If return value is `True`, `n` is squarefree. Otherwise, the squarefreeness is still unknown and `None` is returned.

†The condition is so strong that it seems `n` has to be a prime or a Carmichael number to satisfy it.

This is a ternary version of **lenstra**.

Input parameter `n` ought to be an odd **integer**.

1.1.8 `trivial_test_ternary` – trivial tests, ternary version

`trivial_test_ternary(n: integer) → ternary`

Test the squarefreeness of `n`. The return value is one of the ternary logical constants.

The method uses a series of trivial tests including **lenstra_ternary**.

This is a ternary version of **trivial_test**.

Input parameter `n` ought to be an **integer**.

1.1.9 `trial_division_ternary` – trial division, ternary version

`trial_division_ternary(n: integer) → ternary`

Test the squarefreeness of `n`. The return value is either one of `True` or `False`; `None` never be returned.

The method is a kind of trial division.

This is a ternary version of **trial_division**.

Input parameter n ought to be an **integer**.

1.1.10 `viafactor_ternary` – via factorization, ternary version

`viafactor_ternary(n: integer) → ternary`

Just for symmetry, this function is defined as an alias of **`viafactor`**.

Input parameter n ought to be an **integer**.
